QuickBooks Commerce – Application Screen Descriptions

Brief descriptions of the seven application screens shown in the demo.

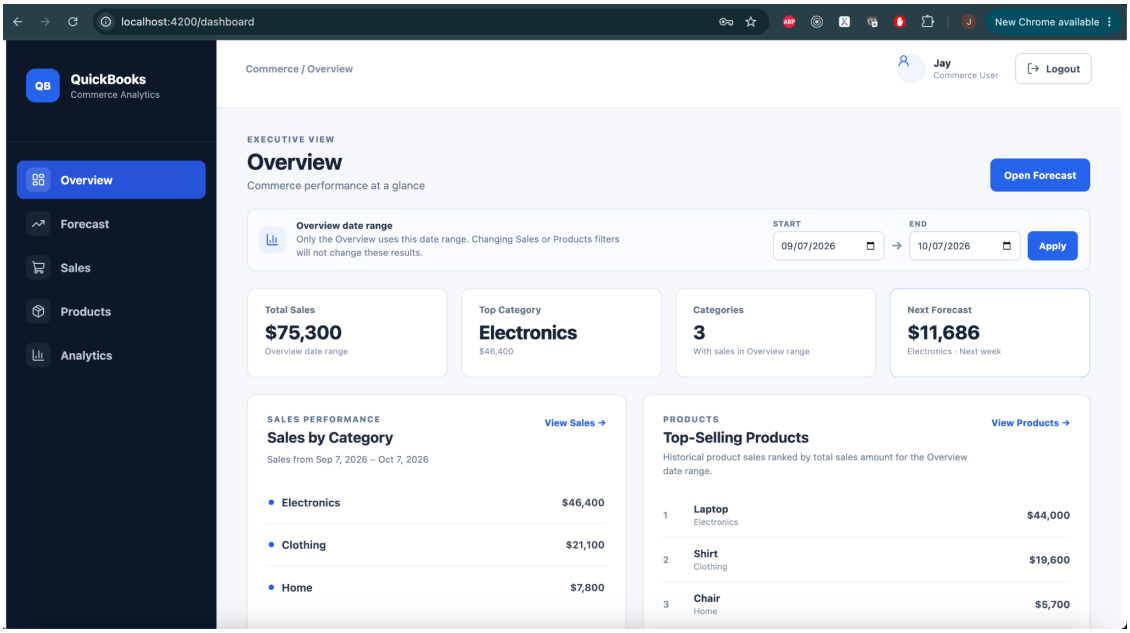

Screen 1 – Login

The login screen provides secure access to the QuickBooks Commerce analytics application. Users enter their credentials to access the sales dashboard and forecasting capabilities.

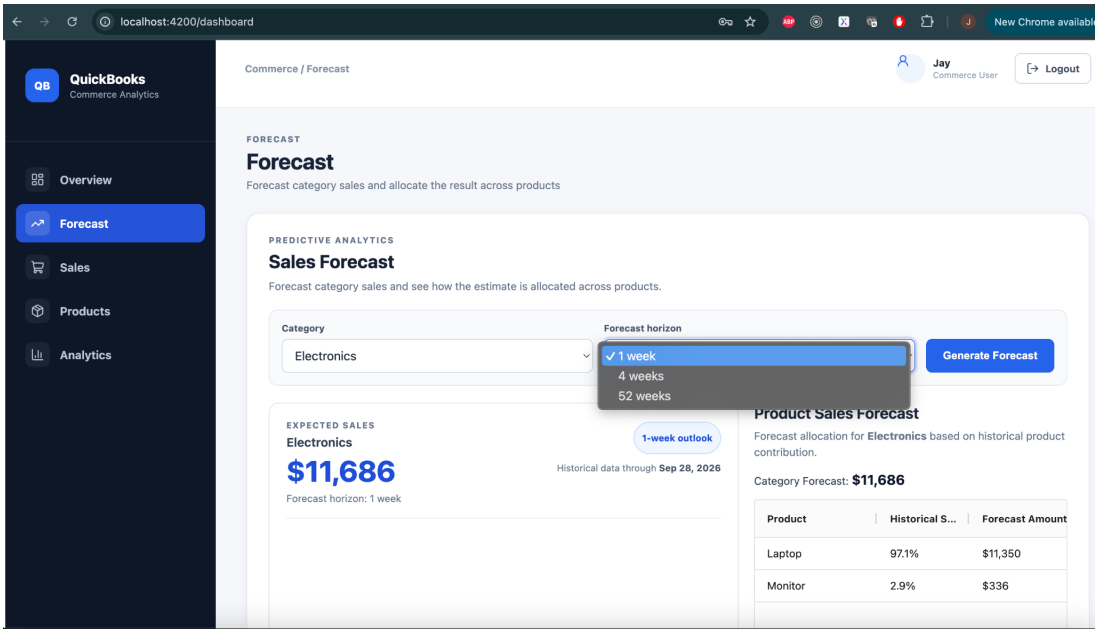

Screen 2 – Overview Dashboard

The Overview dashboard gives users a quick view of commerce performance, including total sales, the top-performing category, number of categories, and the next forecast. It also summarizes category sales and historically top-selling products.

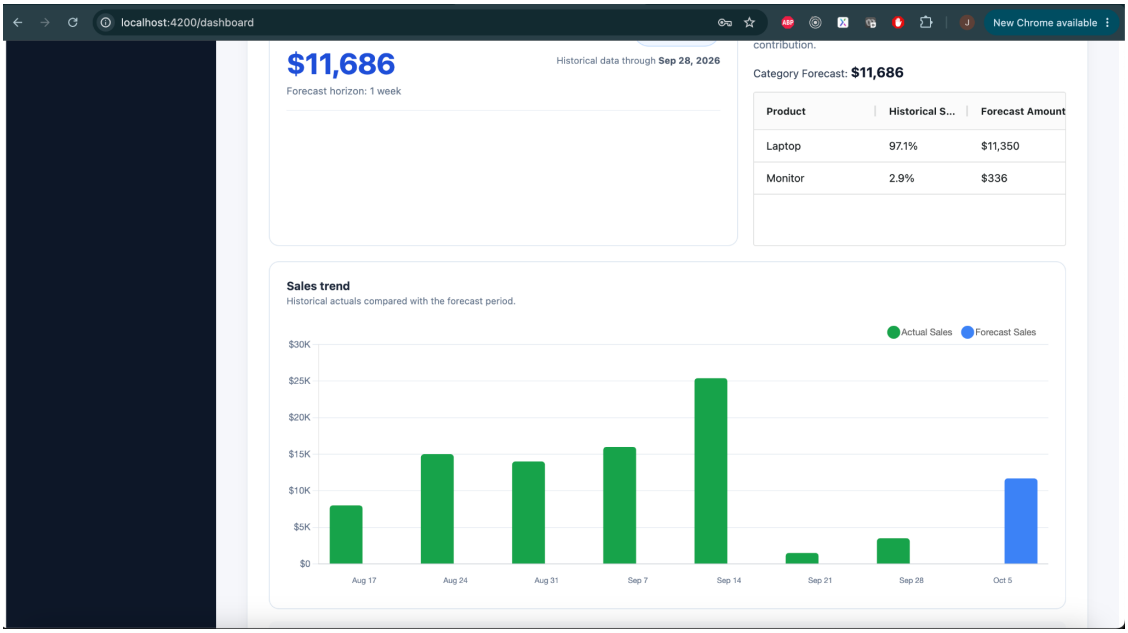

Screen 3 – Sales Forecast

The Forecast screen allows a user to select a category and forecasting horizon, such as 1 week, 4 weeks, or 52 weeks. It displays the expected category sales and shows how the forecast is allocated across products based on historical contribution.

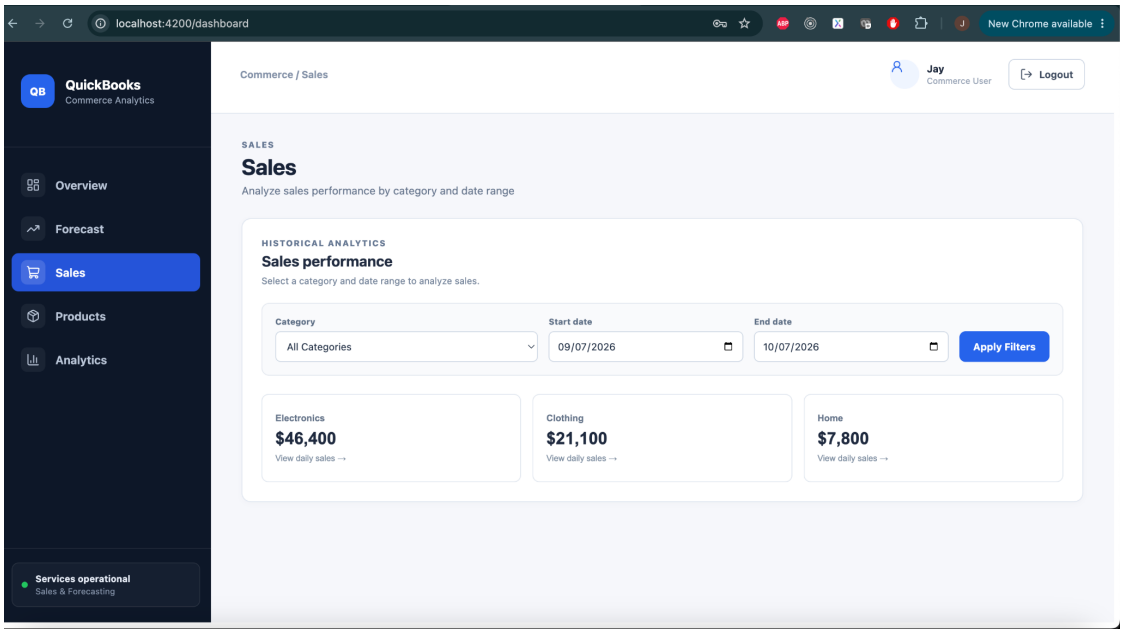

Screen 4 – Forecast Trend

The sales trend chart compares historical actual sales with the forecast period, helping users visually understand recent sales behavior and the expected future sales level.

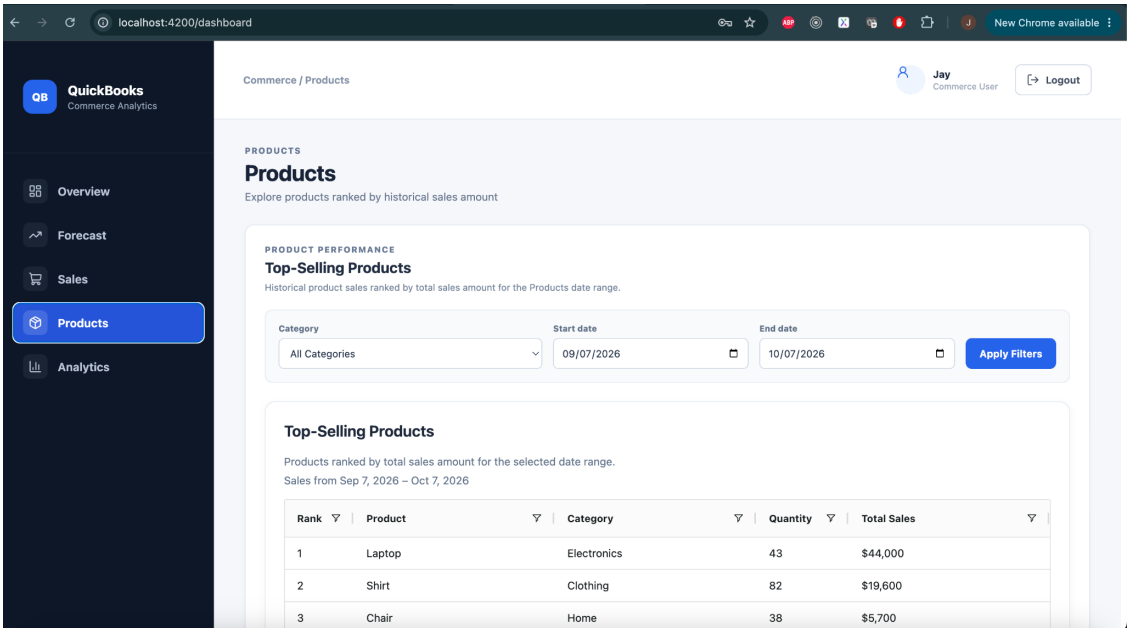

Screen 5 – Sales Analytics

The Sales screen lets users analyze historical sales by category and date range. It provides category-level sales totals and links to the underlying daily sales information.

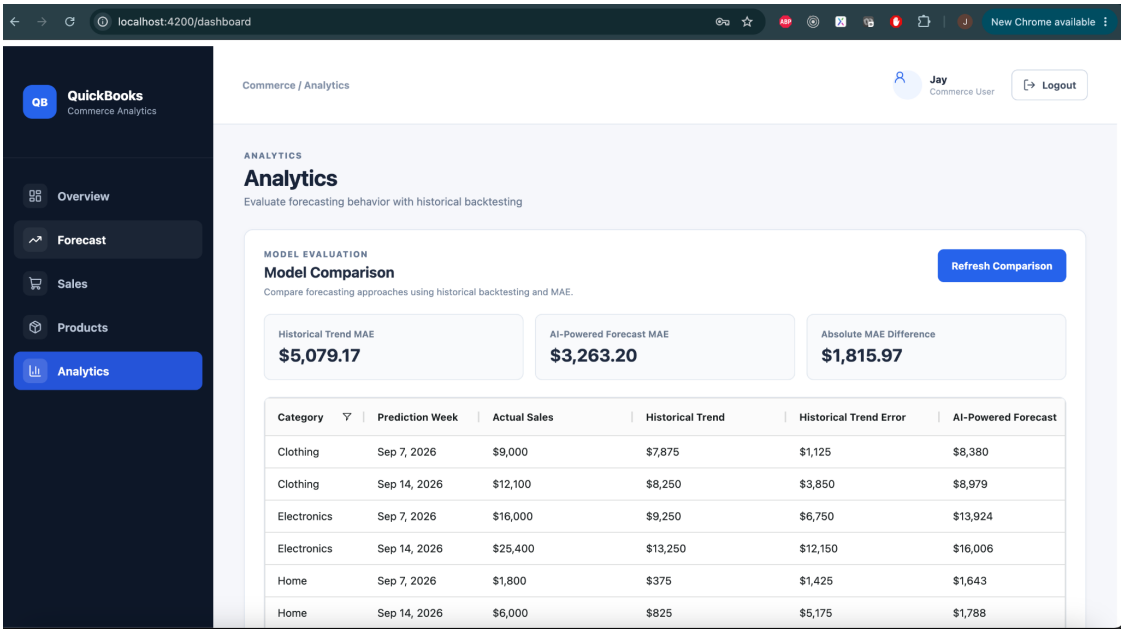

Screen 6 – Products

The Products screen ranks products by historical sales amount for a selected date range. Users can filter by category and review product sales, quantities, and rankings.

Screen 7 – Model Comparison / Analytics

The Analytics screen evaluates forecasting behavior using historical backtesting and Mean Absolute Error (MAE). It compares the historical-trend baseline with the AI-powered forecast to show the difference in forecasting performance.
